

Write your understanding on Packages

Package name: random Random package helps to provide the random numerical values.

method name: randint Randint is the method in random package. It is used to provide the values between the given range(a,b)

method name: random Random is the method in random package. It is used to provide the values between the [0,1).

method name : randrange Randrange provides the range from start to stops according to the steps (start,stop,step)

method name : uniform Uniform gives the float values between the given range(a,b)

Package name : math Math is a package used to perform the mathematical functions

Method name: sqrt sqrt is a method used to provide the square root of the number
sqrt(num)

Method name: pi Pi is a constant value=3.14159.....Used in finding the circle circumference

Method name: pow pow method is used to find the power of the number. represented as pow(num1,num2(num1 to the power of num2))

Method name: sin sin method is used to sin angle(degree) into radians

method name: e # constant no brackets e is the constant value of 2.718...

method name: factorial we can directly find the factorial of the number using
math.factorial(num)

method name: gcd gcd method provided the greatest common factor between the given numbers

Package name: time

Method name: sleep Sleep method is used to provide the outcome after specific amount of seconds. time.sleep(num of seconds)

Package name : sys

Method name: versi

sys method is used to provide the version of the python interpreter installed in the computer on
