

Types of Data

- Data is categorised into two types.
 1. Categorical data
 2. Numerical data
 3. Categorical data stores the data into categories using names or labels

Ex: names,age,gender

2. Numerical data stores the data in the numerical values and this data is divided into two types.
3. Discrete data has the integer values
4. Continuous data has the float values

In []:

2. Levels of Data

There are four levels of data: 1.Nominal level: Nominal level of data comes under categorical data. It deals with the non-numerical data i.e names,labels.However there will be no order and no relation between the names. 2.Ordinal level: Ordinal level of data comes under categorical data. It deals with the non-numerical data i.e names,labels.However there will be order and has relation between the names. 3.Interval level: Interval data comes under numerical data. It does not have exact zero value in it. Ex: year 4.Ratio level: Ratio data comes under numerical data. It has the exact zero value in it. Ex: weight

3. Population vs Sample

- Population involves the complete data
- Sample is the part of population.
